

Licensing

Licensing is the main output from all patented Research & Development (R&D) endeavors. It enables the continuation of our independent R&D, resulting in technology that benefits both businesses and society.

The Basic Business Model

The licensing business model of CBOLABS has three main interfaces with our partners and licensees. First of all, the development of the modules and the platform involved, when typically CBOLABS is managing the project or is advising the licensees own team.

Secondly, CBOLABS is providing and supporting the marketing and distribution of the services involved, i.e. including the delivery to the licensee's clients. Including in this is also the third activity; the training and education involved, which can be performed on a regular basis.

In some cases, CBOLABS can also include the license in a complete franchise program, where the transfer of technology includes BM operations and, whenever chosen, the start-up of a new venture.

Books, studies and reports

Key methodological observations and interpretations from all IM and BM research and licensing activities are also intended to be published as books and e-books, or provided to the market by means of multi-client studies and reports.

Nurturing trading bots

The forthcoming book, Nurturing Trading Bots, is intended for anyone with interest in stock trading and the stock market, both domestic and international, in theory and practice, threats and opportunities. Especially those who understand the importance of diversified stock ownership and seek an understanding of international trade in publicly traded company stocks, beyond the obvious and already well-known.

Existing financial theories' inherent anomalies are portrayed here solely to bring analyses and management closer to the future practice of international stock trading. At best, it is also to influence the development of more coherent management models and well-bred Alpha-robots.

The ambition is to show what all human and artificial actors need to understand about the phenomenon of boundless and global stock trading to analyse and manage stocks successfully. Never in history have the needs been greater for stock actors to make decisions about their future capital management in a timely manner, than today.

For further information and communication on the book, please contact Leif G Bohman at leif.bohman@cbolabs.com.
